

What are the advantages of dental implants?

Dental implants make you feel comfortable

You can eat whatever you want – your teeth are strong and stable. They look like your own teeth and they feel like your own teeth, too. You know that you have chosen the best solution and can smile a confident and beaming smile.

Implants provide an efficient long-term solution

When you maintain good oral hygiene, your implants can last your whole life. This makes implants an efficient and economic long term solution.

Dental implants support your health

When you lose a tooth, the jaw bone and gum starts to resorb, and increasingly so if you lose several teeth. Implants protect healthy teeth, protect from bone loss and helps you keep your natural look.

Teeth as strong as your own

Dental Implants: the best replacement for lost teeth

What is a dental implant?

A dental implant is a titanium “root” that is placed into the jaw bone to support a crown to form an artificial tooth. Titanium is a biocompatible material and does not cause allergic reactions. The implant is usually inserted into the jaw bone under a local anaesthetic, and the bone grows onto the implant and integrates with the surface.

Implant supported teeth look, feel and function like natural teeth.

When the natural roots of teeth are lost, bone resorption in the jaws may occur. These problems can be avoided by inserting dental implants.

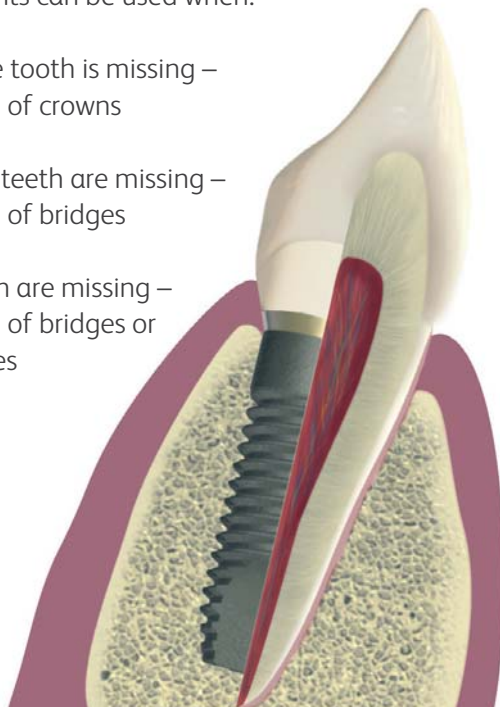

When can dental implants be used?

It does not matter whether teeth were lost through accident, disease or caries, dental implants are an excellent tooth replacement for many patients.

Your dentist will inform you which implant treatment is most suitable for you.

Dental implants can be used when:

- a single tooth is missing – instead of crowns
- several teeth are missing – instead of bridges
- all teeth are missing – instead of bridges or dentures

How does it work?

Treatment procedure

After detailed consultation and examination, a cost projection will be prepared by your dentist. Only when you are comfortable with what will happen, your surgery will take place and the implant(s) will be inserted.

When your dentist is satisfied with the stability of your implant, the final restoration can take place.

Time frame

Usually, four to six visits are required over two to six months. Your dentist will advise you and set up your individual schedule.

Why choose a dental implant over a crown or bridge?

Better looks and greater self-confidence

When roots of teeth are missing, the jaw bone degenerates in these areas. Insertion of dental implants prevents bone resorption and you keep your natural look. Crowns and bridges do not replace the roots and thus are unable to prevent the degeneration that can change the contours of your face and make you look older.

Protection and preservation

To attach a bridge, the dentist often needs to grind down healthy neighbouring teeth. Using dental implants, this is usually not necessary – healthy teeth are protected.

Performance and value

When kept in good oral hygiene, dental implants can last longer than bridges or prostheses. Hence, implants provide a more economic long-term solution.

Why choose a dental implant from Neoss?

Neoss System Implants are made using the best quality medical grade titanium and utilising the most advanced manufacturing methods available.

The implants have a specially treated surface that promotes healing and encourages implant/bone integration. Neoss System Implants are produced to the highest standards for quality and sterility.

The company

At Neoss we constantly improve our products to make the treatment with dental implants even simpler, more successful and cost effective. Our system has been proven very successful and we have financial backing from one of the most successful medical device companies in the world, Medtronic, giving us access to unique research facilities where we can further develop technologies for successful treatments.
